# Lab 1

Jeremy Wright

Lab 1-1

Q1: Problems in the current design.
- The current design has everything in a single class.
- The parser only checks to see if the company logo is google and has an else condition for Microsoft. This means that only the two companies can run this code.
- Everything is thrown into the text field and then parsed from the field itself.

Q2: Why sub-classing and override is a bad idea.
- For each new company that you add, you would have to create a new override method for parse which would be annoying as you added more classes.

Q3:

Q4: Submitted as code.

Q5: Submitted as code.
